What materials can SABIC provide for electric vehicle battery packs?

Depending on material and design requirements, SABIC's Specialties business can provide a number of materials for electric vehicle battery packs, including bus bar holders, covers, brackets, end plate assemblies and enclosures for battery management systems, control units, fuses and relays, etc.

What are EV batteries made of?

EV battery composition and chemistries An EV battery, typically consisting of battery cells arranged in a battery pack, consists of an anode (commonly made of graphite), a cathode (often composed of lithium metal oxides) and an electrolyte (usually a liquid or solid lithium salt) (Figure 6).

What materials are used for battery packs?

SABIC offers a full range of materials for battery packs, including short and long glass fiber-reinforced polypropylene (PP) with non-halogenated flame retardance, and high-temperature engineered thermoplastics.

Can EV batteries be recycled?

This is especially relevant for copper and nickel, whose use in large volumes across industries for many years has resulted in substantial scrap material available for secondary production. Scrap materials from EV battery manufacturing present further recycling potential for other materials in this decade.

What is the most important component of an EV battery?

The cathode and anode represent most of the critical material demand in an EV battery (Argonne National Laboratory, 2023).
