Does peak shaving affect power grid investment?

The stability of the power system is closely related to its level of peak shaving. Therefore, this paper aims to calculate the cost apportionment mechanism for peak shaving and study its impact on power grid investment.

How important is peak shaving in the power system?

Abstract: With the large-scale integration of renewable energy, power balance in the electricity system is becoming increasingly difficult to maintain. The stability of the power system is closely related to its level of peak shaving.

Do coal-fired power plants benefit from peak shaving costs?

A novel peak shaving cost calculation model is proposed for coal-fired power plants. Minutes-level operational data are used to analyze peak shaving costs and profits. Coal-fired power plants may not benefit under the current compensation mechanism. The economic comparison between different coal prices for peak shaving.

Do coal-fired power units provide peak shaving ancillary services?

With the integration of renewable power generation units such as wind and solar power into the grid, coal-fired power units not only need to provide peak shaving ancillary services, but also has a downward trend in its own annual power generation hours. It is urgent to measure and evaluate the peak shaving costs of coal power.

What is peak shaving?

Peak-shaving refers to the reasonable adjustment of power system according to the change of power load to ensure the reliability and stability of a power supply. In the power system, the load usually shows "peak" and "valley" differences.

What happens if a power unit shaves a peak?

Opportunity loss for deep peak shaving The increasing peak depth of coal-fired power units will significantly reduce the power transmission, resulting in a loss of electricity revenue, which is called the peak-shaving additional revenue loss.
