

Can photocatalysts be used in solar nitrogen fertilizers?

????

Inspired by the suspension system, we successfully developed a feasible strategy for fabricating a flexible suspension-like hydrogel-based photocathode to achieve efficient electron collection on the ...

Abstract Harnessing solar energy to convert molecular  $N_2$  into nitrogen-rich chemicals (e.g., ammonia) provides a potential pathway for the manufacture of "solar fertilizers". However, the ...

Fig.6 indicates the curves of the increase in volume of nitrogen oxides as a function of time for the thermal decomposition of solar salt in nitrogen and atmospheric pressure with quartz container ...

Our Laboratory Liquid Nitrogen Containers come with double-wall insulation, lockable lids, and strong aluminum tanks, and we are the supplier focused on reliable performance. Each cryo-container ...

The integration of microbial nitrogen ( $N_2$ ) fixation with photochemical processes using inorganic light-absorbing nanomaterials is a burgeoning field in sustainable energy production.

Efficient nitrogen fixation and hydrogen generation, low fabrication cost, and mechanical durability corroborate the potential of the floatable microbial device toward practical and sustainable solar ...

Thus, nitrogen fixation under mild conditions and through an energy-efficient way is highly desirable. Photocatalytic nitrogen fixation is a green and promising technology for achieving ...
