What is the working principle of solar cells?

All the aspects presented in this chapter will be discussed in greater detail in the following chapters. The working principle of solar cells is based on the photovoltaic effect, i.e. the generation of a potential difference at the junction of two different materials in response to electromagnetic radiation.

How does a solar cell work based on the photovoltaic effect?

When photons of light are absorbed by a semiconductor material, causing the release of electrons and generating an electric current. Figure 1: Solar cell diagram illustrating the working principle based on the photovoltaic effect. Figure 1 shows a schematic layout of a p-n junction based solar cell.

What is a solar cell & how does it work?

Research on solar cells has been conducted for a long time. A solar cell converts solar energy to electrical energy, which is a clean and renewable energy. Along with the solar cell, there has also been another energy conversion system known as the photoelectrochemical (PEC) cell, which has now been studied for a few decades as well.

Can a solar cell generate a photocurrent?

This is the case for solar cells, in which electrons need to be able to exit the n side of the cell and holes need to be able to exit the p side (this will be thoroughly analyzed in Section 3.4). If the flow of the majority carriers is also blocked by the passivation layer, the solar cell cannot generate any photocurrent.

Why do solar cells use p-doped semiconductors?

When the sunlight is absorbed, the energy of some electrons in the semiconductor increases. A combination of p-doped and n-doped semiconductors is typically used to drive these high-energy electrons out of the solar cell, where they can deliver electrical work before reentering the cell with less energy.

What is a solar cell experiment?

For a hands-on approach to understanding the Solar cell experiment, visit our experiment page. A solar cell (photovoltaic cell) is a semiconductor device that converts sunlight into electricity using the photovoltaic effect. It is built from silicon P-N junctions with metal contacts and coatings.

The PEC cell, unlike the traditional solar cell, converts solar energy to chemical energy, and this chemical energy is embodied in a chemical bond. How Does a ...
