

Can a solar tower collector system be used for solar power generation?

In this work, a solar tower collector system for solar power generation was constructed and the experiment was carried out. An integrated dynamic simulation model consisted of heliostat field and air receiver sub-models was developed with experimental validation. The main outcomes of this study can be summarized as follows:

How is solar energy incident to the receiver aperture determined?

The solar energy incident to the receiver aperture is determined by the heliostat field model. Table 2. Different steady performance experimental cases. The thermal efficiency of the air receiver is related to the receiver outlet temperature and air mass flow rate.

What are the simulation results of heat accumulation on the container walls?

displays the simulation results of heat accumulation on the container walls. This simulation considers the solar radiation in clear-sky condition, with the constant supply air temperature inside the container at 0°C. At 07:00 AM, the heat energy from solar radiation begins entering the walls.

Can heliostat field and solar receiver be used as a dynamic model?

Thus, it is essential to develop a dynamic model based on a real heliostat field and solar receiver, which would be used to investigate the dynamic performance of a solar collector system after careful validation and be employed to check and optimize control strategies.

How HFCAL method is used for heliostat field and solar receiver sub-models?

HFCAL method and quasi-2D approach are used for the development of heliostat field and solar receiver sub-models, respectively. Relative errors and root mean square error (RMSE) between the model results and experimental data are calculated to evaluate the model accuracy.

What is concentrated solar power (CSP)?

Concentrated Solar Power (CSP) technologies, including the solar trough, linear Fresnel and solar tower are capable to provide stable electricity when coupled with large-scale thermal energy storage devices [1]. Among the CSP systems, the solar tower is especially attractive due to its high concentration ratio of up to 1000 suns [2].
