

How can battery energy storage systems improve frequency response?

However, with more solar and wind power integrated into the grid, the system's ability to stabilize frequency declines. To address this challenge, Battery Energy Storage Systems (BESS) are now playing a critical role in delivering fast, precise frequency response services.

Why is frequency regulation important?

As Europe transitions to a low-carbon power system with high penetration of renewable energy, maintaining grid stability has become more complex and critical. One essential component of grid reliability is frequency regulation, which ensures the grid's frequency remains stable at 50 Hz.

What is primary frequency control (FCR)?

FCR, or primary frequency control, is the first line of defense when grid frequency deviates from the 50 Hz target. When the frequency drops below or rises above the deadband (49.99-50.01 Hz), FCR providers automatically respond by increasing or decreasing their power output within 30 seconds, sustaining that response for at least 15 minutes.

Does FCR pay for energy usage?

FCR only pays for capacity (availability), not for actual energy usage. The minimum bid size is 1 MW, with bids categorized as divisible or indivisible (the latter capped at 25 MW). What is aFRR (automatic Frequency Restoration Reserve)?
