What is a local voltage control strategy for distributed PV systems?

A local voltage control strategy for distribution networks with distributed PV systems is proposed by Chai et al. (2018). The aim of the strategy is to achieve cost-effective and efficient voltage control by reducing the coordination of the reactive power and optimizing the active power of the photovoltaic systems.

How a PV system can be used as a supplementary voltage regulation resource?

Thanks to the real-time control capability of PV inverters and EV chargers, the PV systems and EVs are applied as supplementary voltage regulation resources in the intraday control.

Do PV inverters play a role in distribution voltage regulation?

In terms of research on PV participation in distribution voltage regulation, refs. [13, 14] dynamically adjust the voltage at the grid connection point based on PV inverters' reactive power compensation capability.

How do PV systems and EVs regulate voltage?

The PV systems and EVs act as supplementary voltage regulation resources. The PV systems are always grid-connected, and their voltage regulation capability is achieved using the device-level reactive power control, with the control range mainly determined by the operating power level (and hence the solar irradiation level).

Do all photovoltaic nodes participate in voltage regulation under centralized control?

However, all photovoltaic nodes participate in voltage regulation under centralized control rather than using fast responses to the volatility of distributed photovoltaics, even when the system error is within the allowable range. Table 3. Comparison of different control methods.

What is a distributed photovoltaic cluster collaborative optimization voltage control strategy?

It proposes a distributed photovoltaic cluster collaborative optimization voltage control strategy based on an improved community algorithm, and the following conclusions are obtained: 1) The decoupling control of active and reactive power is achieved through the analysis of Newton-Raphson power flow computer theory.

The solar energy generation has grown significantly in the past years. The importance of PV penetration in power system as a major element of renewable energy source has seen it being ...

The objective of this paper is to evaluate the effect of rooftop PV generations on distribution losses (power losses) and network voltage profile (voltage regulation on LV network) in a ...
