

Can thermochemical seasonal energy storage system be used for solar district heating?

The present article explored the potential of the thermochemical seasonal energy storage system using MgO/Mg(OH)₂ system for solar district heating applications in China. The solar district heating model with thermochemical seasonal energy storage system, including the parabolic trough solar collector and a chemical reactor, has been built.

What are the advantages of seasonal thermochemical energy storage system?

The needed solar collector areas of the seasonal thermochemical energy storage system decrease by up to 2/3 compared with those of a water storage tank system in the condition of the similar storage system volume. The advantage of seasonal thermochemical energy storage is more obvious for the case of region with abundant solar energy supply.

Can solid/gas thermochemical reactions be adapted to solar thermal systems?

The adaptation of solid/gas thermochemical reactions to solar thermal systems for either heating or cooling has been investigated by Lahmidi et al., who developed a simple model for the dynamic simulation of decomposition (charging) and synthesis (discharging) phases of a H₂O/SrBr₂ working pair.

What is a MiniStor thermal energy storage system?

MiniStor is an innovative compact thermal energy storage system that combines TCM and PCM materials for year-round thermal storage for heating and cooling. It is characterized by a very high energy storage density, over 10.6 times higher than the density of equivalent water-based systems.

What is solar thermochemical hydrogen production (STCH)?

Solar thermochemical hydrogen production (STCH) offers an alternative route that can convert solar energy into heat and later into hydrogen without the need for electricity production. Even though it is a technology with great potential to achieve high solar-to-hydrogen efficiency, there are still uncertainties regarding its commercialization.

What are thermal energy storage systems?

There are various technological solutions acting as Thermal Energy Storage (TES) systems, which can find application at domestic level. In Sensible Heat Storage (SHS) systems, thermal energy is stored by heating or cooling a liquid or solid as water, sand, molten salts, or rocks, with water being the cheapest option.

Thermochemical energy storage, a promising candidate for seasonal solar thermal energy storage, offers an economic solution to mitigate the use of fossil fuels and CO₂ emissions due to its large ...
