How does Peak-Valley electricity price spread affect electricity consumption?

By setting different peak-valley electricity price spread, the electricity consumption changes in the process of gradually increasing peak-valley electricity price differentials are studied. Renewable energy has the characteristics of randomness and intermittency.

Should residential Peak-Valley pricing policies be optimized?

The PVP policy needs to be optimized from the price and time period division. In order to deal with the rapid growth in residential electricity consumption, residential peak-valley pricing (PVP) policies have been implemented in 12 provinces in China. However, being inappropriate, the residential PVP policies have delivered no significant results.

Are electricity pricing policies effective in peak shaving and valley filling?

The focus of power companies is on the variation in the effectiveness of electricity pricing policies in peak shaving and valley filling (Fig. 14). Overall, the current PVP policies in 11 provinces except Gansu are ineffective in peak shaving but are somewhat effective in valley filling.

Does a PVP policy reduce peak power usage?

An electricity demand model based on household characteristic is presented. The peak-shaving effect of the current PVP policy in 11 provinces is less than 3%. Optimized PVP can significantly reduce peak power usage and increase benefits. The PVP policy needs to be optimized from the price and time period division.

How much does electricity consumption change during a peak period?

Generally, the electricity consumptions in the 12 provinces in the peak period decline by 0-12.9%, and electricity bills for the residents change by about -5.4%-10.8% (Fig. 5).

What is a reasonable electricity price in the off-peak period?

Rule 3: If the price difference in the off-peak period between the optimized and current policies is smaller than 0.1 yuan/kWh in a province, this province's electricity price in the off-peak period is considered reasonable.
