Can polymeric membranes be used in vanadium redox flow batteries (VRB)?

This review on the various approaches to prepare polymeric membranes for the application in Vanadium Redox Flow Batteries (VRB) reveals various factors which should be considered when developing new membranes materials with or without the addition of non-polymeric materials.

Why are vanadium redox flow battery systems important?

Battery storage systems become increasingly more important to fulfil large demands in peaks of energy consumption due to the increasing supply of intermittent renewable energy. The vanadium redox flow battery systems are attracting attention because of scalability and robustness of these systems make them highly promising.

How does vanadium permeability affect energy storage time?

Vanadium permeability Diffusion of the V ions from one half-cell to the other leads to discharge of the battery and, thus, determines the energy storage time of the battery. Extensive research has shown that the cationic membranes are susceptible to V permeability due to their attraction of the V species.
