How does a fuse work?

A fuse is a two-terminal device which is placed in series with the circuit it is supposed to protect. It performs its function by melting itself out when the current tries to exceed the specified level, thus breaking the circuit open. Once operated (fused) it must be replaced. Replacing is not a problem because fuses are relatively inexpensive.

What is a fuse & why is it important?

A fuse is the simplest Over Current Protection device(OCPD) in electrical circuits,yet it is very important. A fuse is a two-terminal device which is placed in series with the circuit it is supposed to protect. It performs its function by melting itself out when the current tries to exceed the specified level,thus breaking the circuit open.

What is array protection fuses?

Array Protection Fuse - The current rating will be n times the short circuit current of one string (same as a module s/c current) where n is the number of strings in parallel forming the array as above. Similarly, successively larger currents will need larger fuses till the input of the inverter.

How does a PV system create thermal inertia?

The thermal inertia is created by providing an electrical insulator around the fuse wire with good heat diffusing capability. PV systems have a special configuration different from the usual household loads. Cells are configured in series to form modules in order to raise the voltage to tens of volts,say,45V.

How does a time delay fuse work?

Thus, overcurrent is prevented. A time delay fuse is similar except that it has greater thermal inertia. The thermal inertia is created by providing an electrical insulator around the fuse wire with good heat diffusing capability. PV systems have a special configuration different from the usual household loads.

How does a PV system work?

PV systems have a special configuration different from the usual household loads. Cells are configured in series to form modules in order to raise the voltage to tens of volts, say, 45V. The modules are connected in series to form strings which raises the voltage to around a thousand volts or above.
